Low-Cost Spay/Neuter as easy as 1-2-3

- 1. Call the clinic of your choice to make an appointment for surgery. A receptionist will ask you some questions about your pet to determine if your pet is an appropriate candidate for surgery at our clinic. Surgery will then be scheduled and you will be given pre-operative instructions.
- 2. On the day of surgery please drop off your pet at the specified time as directed. Dogs must be on a leash and cats must be in individual plastic carriers. You must pay for services in the morning when you drop off your pet.
- 3. Pick up your animal the same day at the specified time as directed.

SURGERY FEES*:

Dogs:	Male	Female
Under 65 lb.	\$110 \$120	\$120 \$140

What is a microchip?

The microchip is about the size of a grain of rice that emits a radio signal when a scanner is passed over it. Each microchip contains a unique ID number. The microchip is injected under the skin of your pet, between the shoulder blades.

After the chip is implanted, the ID number is registered with your contact information. If your animal becomes lost, it can be scanned by vets and shelter personnel across the country. This person can now call the Microchip Hotline and report the number. The Hotline person will contact you or your emergency contacts (this way, your information is not out in the public).

Though collars and tags are very important, pets may lose them. Microchips provide a way for your pet to always carry permanent identification.

Only an estimated 2-5% of cats who enter shelters are reclaimed by their owners.

Having your pet microchipped will significantly increase the likelihood that your pet will be returned to you, should it become lost.

Why Tattoo?

Pets with unknown histories are commonly presented to vets and rescues for determination of reproductive status. Over time surgical scars fade and become almost invisible especially for animals spayed at a young age. Being able to identify that an animal has been spayed can in and of itself be life-saving to pets entering shelters. For these reasons, we require every animal altered at our clinic to be tattooed. This is mandatory. It will be a 1cm to 2cm green line next on the pet's abdomen.

Health Benefits of Spay/Neuter

- Spaying by 5 months of age is the best way to ensure your pet does not have an unplanned pregnancy and will reap the most health benefits from spay/neuter.
- Pyometra 1 in 4 female dogs will develop a life-threatening uterine infection or "pyometra" during their lifetime. Spaying before the first heat prevents this.
- Cancer The serious and expensive possibility that your pet will develop cancer or tumors of the reproductive organs is completely eliminated because these organs are removed.
- Heat/Pregnancy During a heat cycle, your pet can become pregnant. After spaying, your pet will no longer go into heat, eliminating the mess and discomfort of living with an animal in heat. Spaying also prevents the possibility of pregnancy and the dangers associated with giving birth.
- Breast Cancer Spaying before the first heat nearly eliminates the chance your pet will develop mammary (breast) cancer.
 Mammary cancer is often fatal since it frequently spreads to the lungs.

Spaying & neutering helps prevent euthanasia of animals in shelter.

Even if you find homes for them, your pet's offspring reduce the chances that shelter pets will find homes.

Be a responsible pet owner, spay or neuter your pet.
